Brower Mechanical Announces Summer Symposium Series

Rocklin, Ca. July 19, 2010 -- Brower Mechanical is pleased to announce their Summer Symposium series. These symposiums are dedicated to providing homeowners and small businesses energy related rebate information on programs that are currently available through their local utilities and government. These symposiums are scheduled for August 13, 14, 27 & 28, 2010 at noon on all days. **The symposium on August 13 & 14 is “How To Obtain Your Maximum Energy Rebates From Your Utility Company And The Government’ and the symposium on August 27 & 28 is “Your Personal Stimulus Program. How To Upgrade Your Home Comfort System And Save Money Every Month And Pocket Rebates For Your Family”.**

“These symposiums are the first of their kind in Northern California. The Brower Energy Solutions Symposiums will provide customers with a place to come and learn about Solar Energy, insulation, ducting, energy saving lighting applications and high efficiency heating and air conditioning equipment and how they can maximize their rebates and tax credits. This includes educational information on how energy from the sun is converted into electricity and how they can become part of the overall energy solution” said Duane Knickerbocker, Vice President of Brower Mechanical. “About the first thing our customer will see when they arrive is information on solar electricity, appliance’s, rebates, high efficiency heating and air conditioning systems, lighting, insulation and whole house fans. These symposiums are designed to be informative and comfortable while having experts on hand to answer specific technical questions and offer solutions.”

Specific emphasis will be placed on rebates and how these rebates can be used to lower the overall cost of each system and the electrical component of their utility bill. Solar electricity has become one of the most common forms of truly renewable energy and has proven itself to be reliable and affordable. Solar Energy has also decreased the load on the overall power grid and this has helped to delay the building of new power plants within California.

As it stands today utility rebates and tax credits will pay for almost half of the overall cost of a system. That means that the balance will usually be less expensive than their current utility fees and most users will enjoy a positive cash flow right from the start. This provides the user with a barrier between them and the ever increasing utility rates in California.

The first 10 people at each symposium will receive a gift card to McCormick and Schmicks just for attending.
